

# DTN Fuel Admin automates eBOL data.

In recent years, the availability of the eBOL data has more than tripled, and it is often accessible within minutes of a load being loaded at the terminal. Due to this, more and more fuel marketers are requesting back office software providers to support eBOL integration. Benefits of eBOLs can help eliminate errors, automate and streamline processes, accelerate customer invoicing and receivables collection, and save on related labor costs. They can, however, have one significant downside: they can be very difficult to integrate into back-office systems. They often come from a wide variety of sources, are delivered in numerous formats, and use inconsistent codes and terminology.

DTN Fuel Admin is designed specifically to streamline your eBOLs, save you time, and make you more profitable. It accomplishes this primarily by automating the flow of eBOL data into your back office.

- DTN Fuel Admin gathers, aggregates, formats, and cross-references eBOLs, making them accessible within minutes. This eliminates the need to deal with multiple data formats and saves hours of manual cross-reference work each day.
- Data can be exported into your back office and displayed as a "human readable" BOL document without any kind of further translation or de-duplication needed.
- An eBOL missing a necessary field can be either withheld from your queue, or appended through manual change or business rules that fit your back office.

"DTN Fuel Admin not only improves customer credit management, but also enhances our ability to provide great customer service. We only regret not having this product sooner."

## DTN Fuel Admin

### Added features for increased efficiency and savings.

Several other features make DTN Fuel Admin the leading solution for fuel buyers.

- You can customize its fields to your content needs, no matter what back-office system you use.
- It provides a unique dashboard view with a simple, robust user interface that eases management of your supplier mapping codes, even as seasonal product changes hit the market and new suppliers come on board. It does so by creating coding consistency for eBOLs from a variety of different sources and formats.
- Invoicing is much simpler and faster because it's integrated fully with your back office. It also tracks and manages transactions across states, helping make tax reporting easier.
- Supplier invoices also can be done in an automated and time-saving fashion. Invoices and BOLs can both be passed to the back office, and if the quantity on the invoice matches that of the BOL, it can be paid automatically.
- It alerts you to any invoice discrepancies instantly. This helps you identify missing BOLs faster, centralize your cross-reference mapping, take advantage of discounts or shorter payment terms, pay invoices faster, and retrieve supplier invoices for future use.
- Documents are saved in a searchable, filterable, and instantly accessible archive for staff, customers, and outside auditors.
- It can scale to handle as many transactions and order management and invoicing processes as your business requires.

Customers who use DTN Fuel Admin often save thousands of dollars in upfront costs and substantially reduce their ongoing maintenance of mapping data. They also benefit from accelerated billing processes, enhanced efficiency, and added profit.
