It goes without saying that quality inventory data is essential to your business. Maximizing supply chain operations, optimizing planning, and making good decisions are just a few of the activities that require frequent collection of high-quality inventory data. Yet it's extremely costly to do that well—until now.

DTN TIMS is the industry's first terminal inventory management system, and is designed specifically to increase your visibility. It will gather inventory and supply and demand information directly from its source, validate it, and pass it along to you—saving you time and money, reducing errors, minimizing risk, and increasing revenue opportunities.

Terminal operators now have comprehensive, real-time inventory views.

DTN TIMS generates significant business value for terminal operators.

It provides an easy, real-time view of the inventory you have at your terminals—whether at a single location, a specific geographic area, company wide, or nationwide. And with its midday inventory balances, you can also see your positions as product is lifted at the terminal.

This visibility of storage capacity enables terminal operators to find places to store more product, taking advantage of potential bargain purchase prices and avoiding run-out situations.

Inefficiencies related to manual data gathering are eliminated through the fully automated and streamlined system.

DTN TIMS

Making your inventory management more efficient.

DTN TIMS contains several features to help you use the application and manage your inventory as simply and efficiently as possible:

A customizable dashboard presents your latest data, important alerts, and key analysis of inventory balances and distribution network activity in one place.

Terminal inventory forecasts, grids, graphs, and alerts help you improve inventory planning, anticipate run-outs and storage constraints, and avoid reactionary spot purchases or sales.

Data can be filtered by product, location, and time frame for focused insight.

Custom alerts let you know immediately when any of your terminal and product combinations fall outside of your set minimum/maximum ranges. This helps you balance supply and demand and fine-tune volumes.

You can export the dashboard's data directly into your systems via spreadsheets, eliminating manual errors.

You can reduce risk, increase revenue opportunities, and enhance cost savings by automating manual tasks with DTN TIMS.
