

WZBob

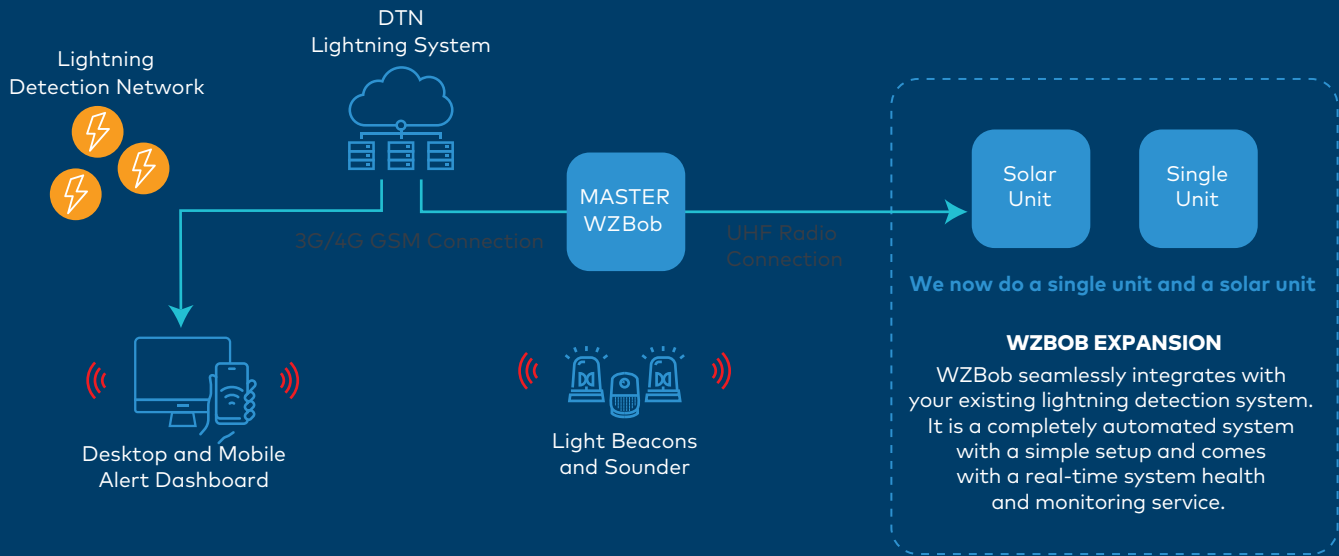

DTN<sup>o</sup>

## In the calm before the storm, equip your sites with sitewide lightning alerting

The WZBob expansion system from DTN extends your lightning alerting capabilities in the field, ensuring your staff stays safe and aware.

You can customize your setup to suit any site arrangement and maximize your coverage by combining light beacons, sounders, and a modular, scalable configuration.

## Typical system setup

### Improve awareness of lightning risks

Ensure simultaneous, sitewide lightning risk communication for your operations — and for contractors and visitors who don't have access to an existing alerting system. The light and sound alerts provide everyone adequate time to act quickly when thresholds are breached.

### Reduce incidents in the field

When lightning alerting systems are limited only to mobile notifications, they can either be easily missed or become a distraction. Providing clear light and sound-based alerts decreases your team's reliance on checking mobile phones, which helps keep their focus on the work at hand.

### Customized to your response plans

WZBob can be customized to your Trigger Action Response Plans (TARPs) and other requirements, ensuring you solidify the safety of your sites based on your existing functional parameters. We like to keep it simple.

### Seamless, scalable integration

WZBob easily integrates with your existing lightning detection network, providing a no-fuss, scalable option for enhancing safety coverage.

### Automated, simple setup

Simple to install, completely automated and supported by a real-time system health and monitoring service.

### The Lightning Network and WZBob

The dual effectiveness of the Total Lightning Network and the WZBob alerting capacities ensure lightning proximity accuracy, increasing safety and decreasing unnecessary shutdowns.
